

Ultimate Header Control

For Corn Harvesting

Foresight

A precision option for corn header control

Benefits of Foresight

- Improves header control near the ground
- Increases harvestable yield in down corn
- Adds protection for chopping heads
- Allows faster harvest speeds

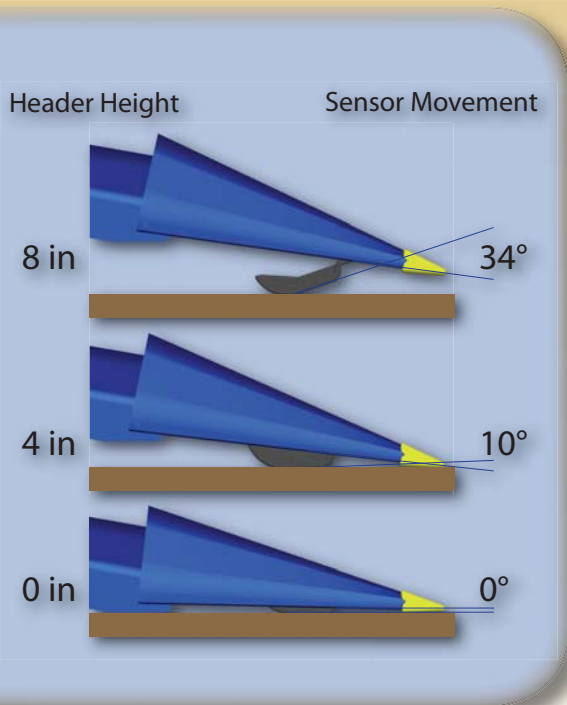

The Problem . . .

At low operating heights where you need the best header control, you have the worst.

Height control sensors lose 50-75% of their ability to control height when the snout tip is touching the ground.

Foresight brings it back!

Because the snout tip stops moving vertically, the height sensor stops moving and the combine stops responding.

(See left)

There is very little sensor movement while the tip is on the ground

“Foresight worked so well, even if it was RED I’d put it on my GREEN combine!”

Brad in Illinois

“It keeps the head on the ground!”

Randy in Nebraska

“You can run so close to the ground with some speed to it . . . and it doesn’t bottom out when doing that”

Jim in Iowa

Foresight is a performance upgrade available on any Headsight header control system using the Insight control box.
